

COVID-19 HOUSEHOLD TRANSMISSION STUDY

This study has been reviewed by the
Hamilton Integrated Research Ethics
Board under project 13049

Version 1, December 7, 2020
Dr. Dawn Bowdish

1

Have you received a recent
positive COVID-19 test from a
provincial testing centre?

2

Are you 18 years or older?

3

Do you live in a household
with 1 or more people?

Living is defined as spending 3 or
more nights per week in the home

We are studying the household transmission of SARS-CoV-2, the virus that causes COVID-19. We are trying to understand why some household members do and do not become infected with COVID-19 when a member of the household tests positive for COVID-19. We would like to understand if the bacteria or immune response in our nose play a protective role in preventing infection with COVID-19.
